

Zend Framework 1.0 – An Overview

Bill Karwin
Product Engineering Manager,
Zend Technologies

Now, the world's most popular web programming language gets even better... A loosely-coupled framework with a flexible architecture that lets you easily build modern web applications and web services.

Zend Framework 1.0 – An Overview

- Introduction to Zend Framework
- Example Zend Framework MVC application
- Benefits of Zend Framework
- Roadmap for Zend Framework future

What is the Zend Framework?

- PHP 5 library for web development productivity
- Open source
 - New BSD license is business-friendly
 - Free for development and distribution
 - CLA process assures that the code is free of legal issues
- Class library – over 150,000 lines of code
- Documentation – over 500 pages
- Quality & testing – over 4,200 unit tests
 - 84%+ code coverage
 - Deployed on many websites already

Zend Framework philosophy

- “Extreme simplicity”
 - Easy solutions for the 80% most commonly-used functionality for web applications
 - Extensibility enables easy customization, to solve the remaining 20%
 - No complex XML configuration files
- Good object-oriented and agile practices
 - Use-at-will architecture
 - Design for extensibility
 - Frequent testing
 - Frequent interaction with user community

Zend Framework quality process

1. Say what you're going to do
 - Proposal process
2. Do it
 - Object-oriented software development
 - Emphasis on unit tests
 - We encourage test-driven development (TDD) as well
3. Verify it matches what you said
 - Frequent and thorough testing with PHPUnit
 - Open-source development and community review

What's in the Zend Framework?

- MVC
- Database
- I18N
- Authentication
- Web Services
- Mail, Formats, Search
- Utility
- Zend_Controller
 - Front controller
 - Routers
 - Action handling
 - Plugins and Helpers
 - Request
 - Response
- Zend_View
 - PHP template class
 - Helpers
 - Filters
- Zend_Json (helps Ajax)

What's in the Zend Framework?

- MVC
 - Database
 - I18N
 - Authentication
 - Web Services
 - Mail, Formats, Search
 - Utility
- Zend_Db_Adapter
 - IBM DB2
 - MS SQL Server
 - MySQL
 - Oracle
 - PostgreSQL
 - SQLite
 - Zend_Db_Profiler
 - Zend_Db_Select
 - Zend_Db_Table
 - Zend_Db_Table_Rowset
 - Zend_Db_Table_Row
 - like ActiveRecord

What's in the Zend Framework?

- MVC
 - Database
 - I18N
 - Authentication
 - Web Services
 - Mail, Formats, Search
 - Utility
- Zend_Locale
 - Zend_Translate
 - Array
 - Csv
 - Gettext
 - Qt
 - Tmx
 - Xliff
 - Zend_Date
 - Zend_Measure

What's in the Zend Framework?

- MVC
 - Database
 - I18N
 - Authentication
 - Web Services
 - Mail, Formats, Search
 - Utility
- Zend_Auth
 - DbTable
 - Digest
 - Http
 - Zend_Session
 - Persist identity, other data
 - Zend_Acl
 - Manage roles, privileges

What's in the Zend Framework?

- MVC
 - Database
 - I18N
 - Authentication
 - Web Services
 - Mail, Formats, Search
 - Utility
- Zend_Http_Client
 - Zend_Rest_Client
 - Zend_Service
 - Akismet
 - Amazon
 - Audioscrobbler
 - Delicious
 - Flickr
 - Simpy
 - Strikelron
 - Yahoo
 - Zend_Feed (RSS and Atom)
 - Zend_Gdata (Google Data API)
 - Zend_XmlRpc_Client

What's in the Zend Framework?

- MVC
 - Database
 - I18N
 - Authentication
 - Web Services
 - Mail, Formats, Search
 - Utility
- Zend_Mail
 - Zend_Mime
 - Read or send email

 - Zend_Pdf
 - Read, edit & create PDF documents

 - Zend_Search_Lucene
 - Search engine
 - Apache Lucene compatible

What's in the Zend Framework?

- MVC
 - Database
 - I18N
 - Authentication
 - Web Services
 - Mail, Formats, Search
 - Utility
- Zend_Cache
 - Zend_Config
 - Zend_Console_Getopt
 - Zend_Filter
 - Zend_Filter_Input
 - Zend_Loader
 - Zend_Log
 - Zend_Memory
 - Zend_Registry
 - Zend_Validate

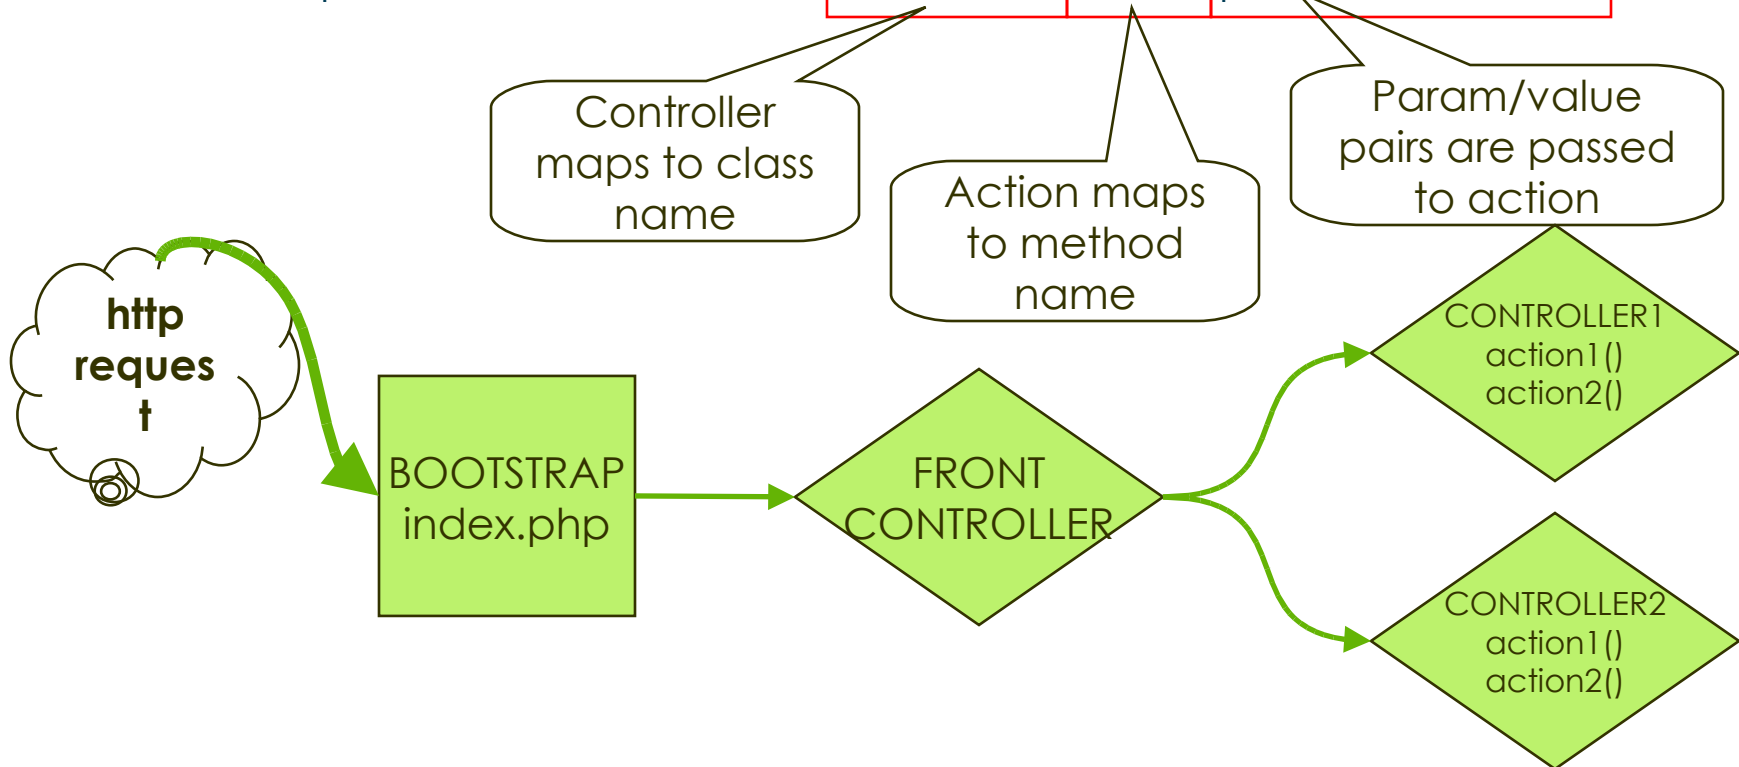

What is the MVC component?

- The heart of ZF web applications
 - Best practice for application workflow
 - Design pattern that dates back to Smalltalk, circa 1979
- Model: data provider
View: user interface
Controller: request processor
- Simple solution in most applications
 - Sensible defaults are built in
 - Flexible and extensible
 - Supports advanced applications

Features of MVC

- The *Front Controller* routes requests to controllers
- Routing is a mapping of URL parts to controllers
 - `http://framework.zend.com/controller/action/param1/value1/...`

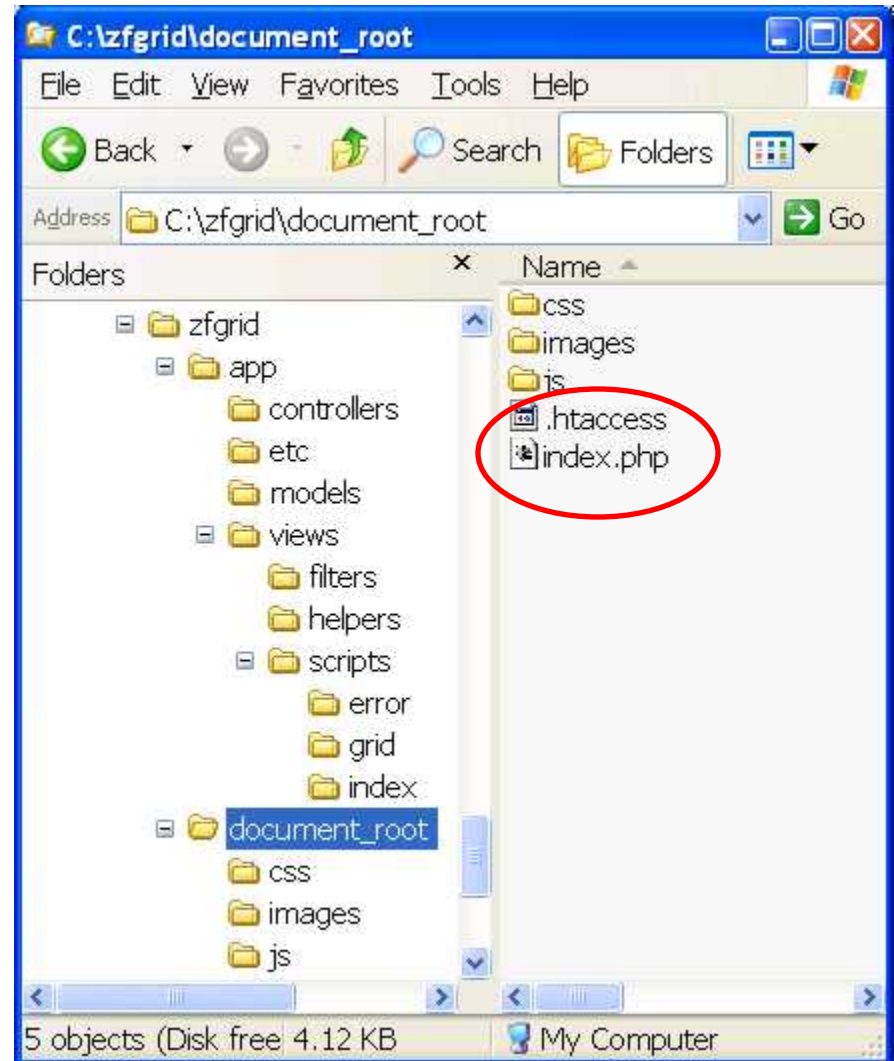

Features of MVC

- Declare custom routing rules
 - Not limited to “controller/action/param” format
- Optional Controller Plugins, Action Helpers, and View Helpers
 - ErrorHandler plugin handles exceptions, 404 errors, etc.
 - FlashMessenger, Redirector, ViewRenderer helpers
 - Output common HTML elements in views
- Extensible interfaces
 - Write your own plugins and helpers

Example MVC application

How to use MVC: bootstrap

- Document root
 - **.htaccess**
enables Apache *RewriteEngine*, which redirects requests to bootstrap script
 - **index.php**
instantiates the Front Controller, which routes requests to the correct controller

How to use MVC: .htaccess

```
RewriteEngine on  
# funnel all requests to index.php  
# except requests for static resources  
RewriteRule !\.(js | ico | gif | jpg | png | css)$ index.php
```

How to use MVC: index.php

```
<?php
error_reporting( E_ALL | E_STRICT );

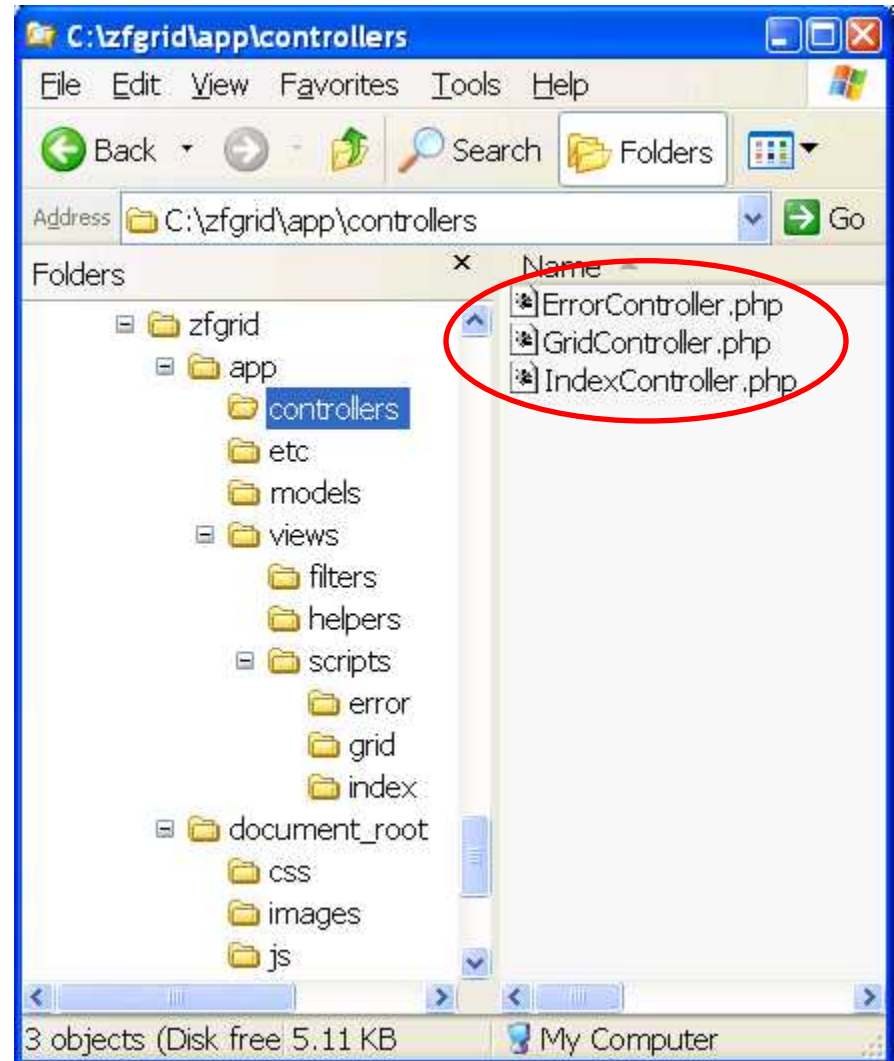

// optional but handy
require_once 'Zend/Loader.php';
Zend_Loader::registerAutoload();

// where is the rest of the application?
$appDir = dirname(dirname(__FILE__)) . '/app';

// convenience method to dispatch
Zend_Controller_Front::run("$appDir/controllers");
```

How to use MVC: controllers

- Controller classes handle groups of request URLs
<http://zend.com/controller/action>
The default controller class is "IndexController"
- Action methods in each controller class handle individual requests
<http://zend.com/controller/action>
The default action method is "indexAction()"

How to use MVC: IndexController.php

```
class IndexController extends Zend_Controller_Action
{
    protected $_db;

    public function init()
    {
        $params = array('dbname' => 'xxx',
                       'username' => 'xxx', 'password' => 'xxx');
        $this->_db = Zend_Db::factory('Mysqli', $params);
    }

    public function indexAction()
    {
        $this->view->tableList = $this->_db->listTables();
    }
}
```

How to use MVC: views

- Views are PHP-based script templates to present data
- Views should contain only display logic, not business logic

Tip: if two View scripts display the same data, you should not need to duplicate code to prepare the data; you should write that code in a Model class

How to use MVC: index.phtml

```
1. <html>
2.   <head>...</head>
3.   <body>
4.     <h1>Zend Framework 1.0 MVC/Database example a
5.     <? if ($this->tableList): ?>
6.     <h2>Tables:</h2>
7.     <ul>
8.       <? foreach ($this->tableList as $tableName): ?>
9.         <li>
10.          <a href="/zfgrid/grid/show/table/<?= $tableName ?>">
11.            <?= $tableName ?>
12.          </a>
13.        </li>
14.      <? endforeach; ?>
15.    </ul>
16.    <? endif; ?>
17.  </body>
18.</html>
```

Loop over list of tables

Link to grid controller contains 'table' param

How to use MVC: output of index.phtml

Zend Framework 1.0 MVC/Database example application - Mozilla Firefox

File Edit View History Bookmarks Tools Help

http://localhost/zfgrid/index

Doc Zend JIRA for ZF ZFDEV Home ZFPROP Home FishEye

Zend Framework 1.0 MVC Database example application

Tables:

- [city](#)
- [country](#)
- [countrylanguage](#)

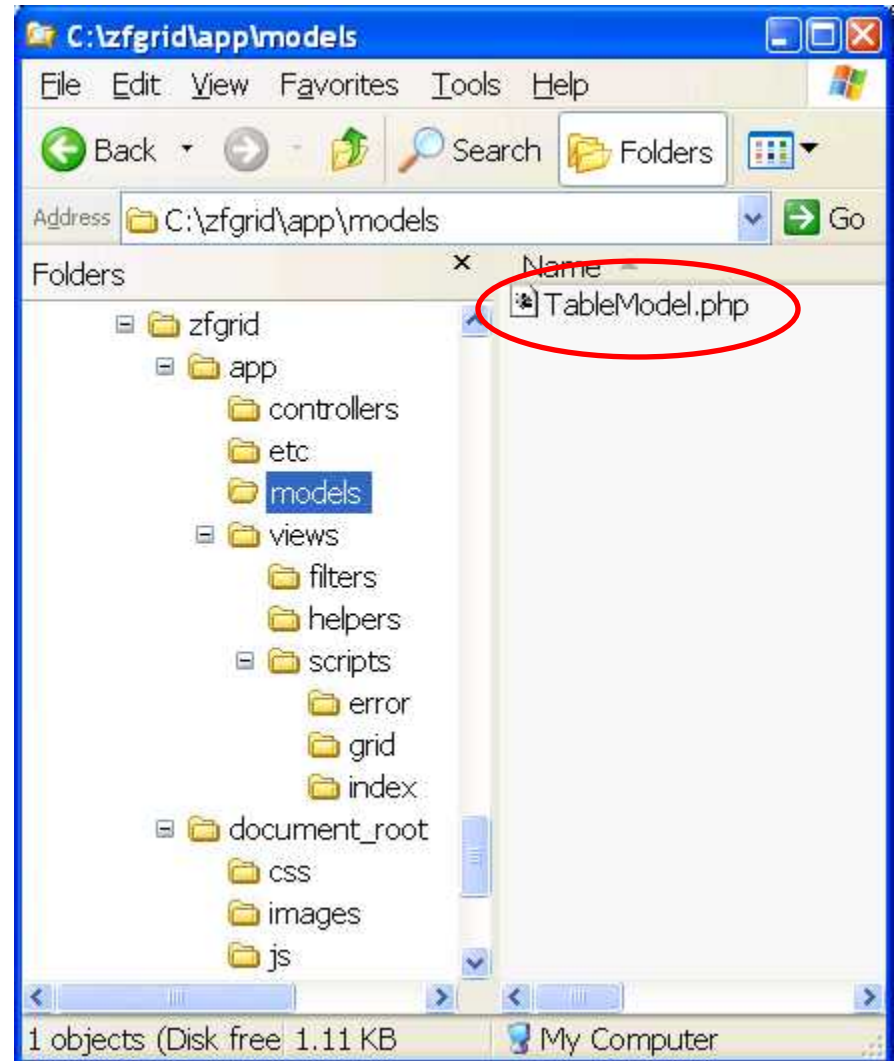

Done

Controller is 'index'

Example of missing action.
It's 'index' by default

How to use MVC: models

- Model classes contain business logic to prepare complex data for presentation
- Often employs database queries, but it could fetch an RSS feed, etc.
- A controller action may use multiple models

How to use MVC: TableModel.php

```
class TableModel extends Zend_Db_Table_Abstract
{
    /*
     * No code is necessary in this case.
     * The Controller will tell this object which table to read.
     * All methods are inherited from the parent class.
     */
}
```

How to use MVC: GridController.php

```
1. class GridController extends Zend_Controller_Action
2. {
3.     public function init()
4.     {
5.         $tableName = $this->_getParam('table', false);
6.         if ($tableName === false) {
7.             $this->_redirect('/index');
8.         }
9.         $this->_model
10.        = new TableModel(array('name' => $tableName));
11.
12.     public function showAction()
13.     {
14.         $order = $this->_getParam('order', null);
15.         $count = (int) $this->_getParam('count', 20);
16.         $offset = (int) $this->_getParam('offset', 0);
17.         $this->view->tableInfo = $this->_model->info();
18.         $this->view->rowset = $this->_model->fetchAll(
19.             null, $order, $count, $offset);
20.     }
```

Default value if
'table' param
is not present

Create a
Model object

Call methods to get data
from the Model object

Pass data to
the View object

How to use MVC: index.phtml

```
1. <table cellpadding="0" cellspacing="2">
2.   <tr class="rowHead">
3.     <? foreach ($this->tableInfo['cols'] as $columnName): ?>
4.     <th>
5.       <a href="/zfgrid/grid/show/table/<?=$this->tableInfo['name'] ?
6. >/order/<?=$columnName ?>">
7.       <?=$columnName ?></a>
8.     </th>
9.     <? endforeach; ?>
10.  </tr>
11.  <?php $i = 0; $stripeClass = array('rowEven', 'rowOdd');
12.  <? foreach ($this->rowset as $row): ?>
13.  <tr class="<?=$stripeClass[$i++%2] ?>">
14.    <? foreach ($this->tableInfo['cols'] as $columnName): ?>
15.    <td>
16.      <?=$this->escape($row->$columnName) ?>
17.    </td>
18.    <? endforeach; ?>
19.  </tr>
20.  <? endforeach; ?>
</table>
```

Loop over list of column names

Link contains 'order' parameter to sort by column

Loop over rowset

Loop over columns in each row

Output data content

How to use MVC: output of grid/show.phtml

The screenshot shows a web browser window with the URL `http://localhost/zfgrid/grid/show/table/city/order/Name`. The browser title is "Zend Framework 1.0 MVC/Database example". The page content includes a "Return to home" link and a table of city data. Callouts identify the following components:

- Controller:** Points to the `grid/show` part of the URL.
- Action:** Points to the `table/city` part of the URL.
- 'table' Parameter:** Points to the `table` part of the URL.
- 'order' Parameter:** Points to the `order` part of the URL.

ID	Name	CountryCode	District	Population

Examples of some Zend Framework benefits

- Improving application security
- Encouraging best practices
- Avoiding reinventing the wheel

3 tools ZF offers to improve application security

1. Zend_Filter_Input
2. Zend_Auth
3. Zend_View

- Processes values of form fields
- Declares rules for filtering and validating input data
- Serves as a “cage” for data; only valid data come out
- Provides method for escaping values, to make them safer for HTML output

3 tools ZF offers to improve application security

1. Zend_Filter_Input
2. Zend_Auth
3. Zend_View

- Abstract interface to login credential storage
- Provides adapters for several directory solutions
 - Digest
 - Http
 - Database table
 - others
- Write your own custom directory adapters

3 tools ZF offers to improve application security

1. Zend_Filter_Input
2. Zend_Auth
3. Zend_View

- Provides a method to format PHP objects more safely for HTML:

```
<?= $this->escape($this->var); ?>
```

4 ways ZF encourages best practices

1. Object-oriented programming
2. Testing
3. Documentation
4. Extremely simple

- Most classes are reusable and extensible, allowing you to write less code
- User-defined extensions, plugins, and adapters implement interfaces and should be well-designed classes
- Uses many other design patterns

4 ways ZF encourages best practices

1. Object-oriented programming
2. Testing
3. Documentation
4. Extremely simple

- MVC Request and Response can be simulated
- Built-in testability for Controllers
- Extensive collection of PHPUnit test suites serves as useful example

4 ways ZF encourages best practices

1. Object-oriented programming
2. Testing
3. Documentation
4. Extremely simple

- Framework development process requires complete manual coverage for every component
- Framework coding standards include complete API docblocks to support reference documentation and development tools

4 ways ZF encourages best practices

1. Object-oriented programming
2. Testing
3. Documentation
4. Extremely simple

- Simple interfaces are better for:
 - Usability
 - Extensibility
 - Testability
 - Maintainability
- Avoid “AntiPatterns”
 - Functional decomposition
 - Spaghetti code
 - Sequential coupling
 - <http://www.antipatterns.com/>

5 ways ZF helps to avoid reinventing the wheel

1. Zend_Acl
2. Zend_Feed
3. Zend_Log
4. Zend_Cache
5. Zend_Config

- Manages application roles, resources and privileges
- Roles and Resources may be user-defined classes
- Supports rule inheritance
- Supports conditional application of rules

5 ways ZF helps to avoid reinventing the wheel

1. Zend_Acl
2. Zend_Feed
3. Zend_Log
4. Zend_Cache
5. Zend_Config

- Consume RSS feed in a single line of PHP code
- Discover feed links automatically
- Imports feeds from multiple sources
- Provides feed building and posting operations

5 ways ZF helps to avoid reinventing the wheel

1. Zend_Acl
2. Zend_Feed
3. Zend_Log
4. Zend_Cache
5. Zend_Config

- Support advanced yet easy logging operations in your application
- Inspired by log4j
- Supports user-defined log formatting and writing

5 ways ZF helps to avoid reinventing the wheel

1. Zend_Acl
2. Zend_Feed
3. Zend_Log
4. Zend_Cache
5. Zend_Config

- Provides an interface to access persisted data
- Supports tagging, manipulating, iterating, and removing subsets
- Supports multiple cache storage backends (e.g. file, database, memcached, and Zend Platform)

5 ways ZF helps to avoid reinventing the wheel

1. Zend_Acl
2. Zend_Feed
3. Zend_Log
4. Zend_Cache
5. Zend_Config

- Simplifies usage of configuration data for applications
- Provides a property-driven OO interface for accessing data hierarchy
- Supports multiple storage formats (.INI files, XML)
- Supports inheritance of configuration sections
- Optional; Zend Framework is configuration-less

Zend Framework Roadmap

- Zend Framework 1.0.1 – by August 1
- Zend Framework 1.1.0 – by October 8
- Develop online tutorials and examples
- Continue to foster our Web Services ecosystem
- Support digital identity management
- Provide advanced Web Forms solution
- Integrate with development tools, including visual tools like Zend Studio
